## Synthesis and antitumor activity of substituted 3-(5-imidazo[2,1-b]thiazolylmethylene)-2-indolinones.

Andreani A, Granaiola M, Leoni A, Locatelli A, Morigi R, Rambaldi M, Giorgi G, Salvini L, Garaliene V.

Dipartimento di Scienze Farmaceutiche, Universita di Bologna, Italy.  
aldoandr@alma.unibo.it

The synthesis of 3-(5-imidazo[2,1-b]thiazolylmethylene)-2-indolinones, analogs of compounds recently published, is described. The EIZ isomerism was studied by means of nuclear Overhauser effect experiments and X-ray crystallography. All the compounds were tested as potential antitumor agents. They were also tested as potential inhibitors of cyclin-dependent kinase 1 (CDK1), in order to determine if the antitumor activity was related to this mechanism of action. The results showed that under certain substitution conditions (5-methoxy group for the indole benzene ring and 2-methyl group for the imidazothiazole system), an interesting antitumor activity was found for some compounds. From the analysis of the antitumor data, 3-1(2,6-dimethylimidazo[2,1-b]thiazol-5-yl)methylenel-5-methoxy-2-indolinone was the most active of the whole series.
